Science and Secrets of Early Medicine Sep 14 2022 A pictorial history and in essence, medical archaeology, by the author of *The Century of the Surgeon*. In Egypt, the Ebers Papyrus (not later than 2100 B.C.) is actually a first textbook; there too, where they tried to cure, they also perfected the art of embalming and from the buried evidence many of the diseases then prevalent can now be identified. Including India, China, Mexico and Peru, this provides a visual history-- there are some 370 illustrations, eight in full color, and it is a fascinating book to look at and learn from.

The Future of Human Nature Sep 02 2021 Recent developments in biotechnology and genetic research are raising complex ethical questions concerning the legitimate scope and limits of genetic intervention. As we begin to contemplate the possibility of intervening in the human genome to prevent diseases, we cannot help but feel that the human species might soon be able to take its biological evolution in its own hands. 'Playing God' is the metaphor commonly used for this self-transformation of the species, which, it seems, might soon be within our grasp. In this important new book, Jürgen Habermas – the most influential philosopher and social thinker in Germany today – takes up the question of genetic engineering and its ethical implications and subjects it to careful philosophical scrutiny. His analysis is guided by the view that genetic manipulation is bound up with the identity and self-understanding of the species. We cannot rule out the possibility that knowledge of one's own hereditary factors may prove to be restrictive for the choice of an individual's way of life and may undermine the symmetrical relations between free and equal human beings. In the concluding chapter – which was delivered as a lecture on receiving the Peace Prize of the German Book Trade for 2001 – Habermas broadens the discussion to examine the tension between science and religion in the modern world, a tension which exploded, with such tragic violence, on September 11th.

The Triumph of Surgery Jan 26 2021 "Triumph of Surgery" begins with the use of local anesthesia, which made it possible to treat cases that had previously been inoperable - tumors of the brain and spinal cord, goiters, pulmonary tuberculosis, hernia, diseases of the eye and nerves. Through the pages of the story move the vivid figures of the Mayo brothers, of Charcot and Freud; Marion Sims, the American doctor of the Empress Eugenie, and others.

Time in Embodied Interaction Oct 23 2020 This is the first book dedicated to the study of the complexities that arise in embodied interaction from the multiplicity of time-scales on which its component processes unfold. It shows in microscopic detail how people synchronize and sequence modal resources such as talk, gaze, gesture, and

object-manipulation to accomplish social actions. The studies show that each of these resources has its own temporal trajectory, affordances and restrictions, which enable and constrain the fine-grained work of bodily self-organization and interaction with others. Focusing on extended interactional time scales, some of the contributors investigate ways in which larger interactional episodes and relationships between actions are brought about and how actions build on shared interactional histories. The book makes a strong case for the use of video in the study of social interaction. It proposes an enlarged vision of Conversation Analysis that puts the body and its interactive temporalities center stage.

Molecular Imaging in Oncology Feb 13 2020 The impact of molecular imaging on diagnostics, therapy, and follow-up in oncology is increasing steadily. Many innovative molecular imaging probes have already entered clinical practice, and there is no doubt that the future emphasis will be on multimodality imaging in which morphological, functional, and molecular imaging techniques are combined in a single clinical investigation. This handbook addresses all aspects of molecular imaging in oncology, from basic research to clinical applications. The first section is devoted to technology and probe design, and examines a variety of PET and SPECT tracers as well as multimodality probes. Preclinical studies are then discussed in detail, with particular attention to multimodality imaging. In the third section, diverse clinical applications are presented, and the book closes by looking at future challenges. This handbook will be of value to all who are interested in the revolution in diagnostic oncology that is being brought about by molecular imaging.

Anesthesia in Cosmetic Surgery Mar 08 2022 One major by-product of the aging baby-boom generation has been a surging interest in cosmetic surgery. Out-patient cosmetic surgery clinics have sprouted up in droves all over the U.S., and the number of cosmetic procedures performed in 2005 increased by over 95% from the previous year. Although procedures like facelifts and abdominoplasties (the 'tummy-tuck') are considered minimally invasive, the anesthetic protocols and regimens here are often overly complex and unnecessarily toxic. Major complications involving anesthesia in this (and any other) surgical milieu can range from severe post-operative nausea and vomiting (PONV) to neuromuscular spasticity to mortality. The mortality spectrum of things may be rare, but there have been many cases in which perfectly healthy cosmetic surgery patients require emergency intervention due to a severe complication involving anesthesia. In recent years, many new anesthetic protocols have been developed to reduce the incidence of PONV and other complications, while ensuring that effective pain management and level of 'un-awareness' during surgery is always maintained.

Dermal Replacements in General, Burn, and Plastic Surgery Dec 13 2019 The skin is the largest human organ system. Loss of skin integrity due to injury or illness results in a substantial physiologic imbalance and ultimately in severe disability or death. The most common cause of significant skin loss is thermal injury, followed by trauma and chronic ulcerations. Over the past decades extraordinary advances have been made in the understanding of cellular and molecular processes of wound healing and the pathobiology of chronic wounds. This knowledge has led to wound care innovations that facilitate more rapid closure of wounds with better functional and aesthetic outcome. A sensible and resource-saving utilization of these innovative technologies requires a broad knowledge of these processes and innovations. This book intends to give an overview about today's wound care developments in tissue engineering and skin replacement. It presents a variety of indications and diversities of clinical applications to help the surgeon select a specific procedure for each clinical situation.

Bone and Joint Infections May 30 2021 Infections of the bones (osteomyelitis) and joints (septic arthritis) are serious health problems which require antibiotics and often surgery. Awareness among health professionals of the causes and treatment options for various types of bone and joint infections is essential for effective resolution. *Bone and Joint Infections* takes a multidisciplinary approach in covering the diagnostic and therapeutic treatment of osteomyelitis and septic arthritis, including different types of implant-associated infections. Correct and rapid diagnosis of bone and joint infection is crucial, and requires the input of a variety of specialists. *Bone and Joint Infection* takes a similarly collaborative and comprehensive approach, including chapters authored by clinicians, laboratory specialists, and surgeons. Covering the basic microbiology and clinical aspects of bone and joint infection, this book will be a valuable resource both for researchers in the lab and for physicians and surgeons seeking a comprehensive reference on osteomyelitis and septic arthritis.

Intercorporeality Jul 20 2020 This book draws inspiration from Maurice Merleau-Ponty's concept of intercorporeality to offer a new, multidisciplinary perspective on the body. By drawing attention to the body's ability to simultaneously sense and be sensed, Merleau-Ponty transcends the object-subject divide and describes how bodies are about, into, and within other bodies. Such inherent relationality constitutes the essence of intercorporeality, and the chapters in this book examine such relationality from a host of diverse perspectives. The book begins with an introductory chapter in which the editors review the current research on bodily interaction, and introduce the notion of intercorporeality as a potentially integrative framework. The first section then offers four chapters devoted to clarifying theoretical and developmental perspectives on intercorporeality. Section 2 contains three chapters that provide insight on intercorporeality from evolutionary, historical, and cross-sectional perspectives. In Section 3, four chapters examine the intercorporeal nature of meaning-making during human interaction. Section 4 then presents three chapters that explore the intercorporeal nature of multi-agent interactions and the role that non-animate bodies (i.e., objects) play in such interaction. Throughout all the chapters, the authors work to integrate research in their specific discipline into the larger, transdisciplinary notion of intercorporeality. This collection provides an indisputably unique perspective on bodies-in-interaction, while simultaneously offering an interdisciplinary way forward in contemporary scholarship on bodies, meaning, and interaction.

being forged between surgeons and machines such as computers and robots, enabling them to perform certain skilled tasks better than either can do alone. The 19 chapters in part I, Technology, explore the components -- registration, basic tools for surgical planning, human-machine interfaces, robotic manipulators, safety -- that are the basis of computer-integrated surgery. These chapters provide essential background material needed to get up to speed on current work as well as a ready reference for those who are already active in the field. The 39 chapters in part II, Applications, cover eight clinical areas -- neurosurgery, orthopedics, eye surgery, dentistry, minimal access surgery, ENT surgery, craniofacial surgery, and radiotherapy -- with a concluding chapter on the high-tech operating room. Each section contains a brief introduction as well as at least one "requirements and opportunities" chapter written by a leading clinician in the area under discussion.

Overload, Performance Incompetence, and Regeneration in Sport Dec 05 2021 This volume summarizes the proceedings of the Reisenburg workshop which took place at Reisenburg Castle in November 1997. The castle is built on the site of an ancient Roman compound and situated in the south of Germany at the Danube river. Scientists from Australia, Austria, Belgium, Estonia, Germany, Italy, Netherlands, South Africa, Switzerland, and the United States participated in the workshop. Like the 1996

workshop, the proceedings of which will be published in *Medicine and Science in Sports and Exercise* in 1998, the 1997 workshop also focused on the topic of overtraining in its widest sense to deepen our knowledge in this particularly sensitive field of sports science and sports practice. The authors see the present volume in a context with the proceedings presented by Guten (ed.) "Running Injuries"; Saunders, Philadelphia (1997) and Kxeider, Fry, and O'Toole (eds.) "Overtraining in Sport"; Human Kinetics, Champaign IL (1997). Overtraining, that is, too much stress combined with too little time for regeneration, can be seen as a crucial and threatening problem within the modern athletic community, of which significance can already be recognized reading daily newspapers: ". . . During the 1996 European championships, a gymnast shook his head almost imperceptibly, closed his eyes briefly and left the arena without looking up. He was fatigue personified. 'Suddenly, I just couldn't do any more. I just wanted to rest'". A look at his schedule showed why.
