[Parasites of Homo sapiens](#) Apr 09 2022 Homo sapiens rank among the most parasitized of all animals. In part this is because we know so much about all aspects of the biology of our species, but in addition, our varied habitat and diet and our global distribution exposes us to more infections than any other species. Whereas some familiar parasitic infections are responsible for much human

Disease Selection Nov 23 2020 Disease Selection: The way disease changed the world explores the host-pathogen relationship and the way communicable diseases have evolved often to stay one step ahead of interventions. From sexually transmitted disease through to ancient and

modern great plagues, parasites, food, zoonoses, climate change and populations, this book explores the way disappeared and emergent diseases have shaped our world just as much as nature has. This book provides key information and is a valuable resource for students, practitioners and researchers working in global health and anyone interested in understanding of the basis of disease.

Chondroitin Sulfate Oct 15 2022 CS is an unbranched, polydisperse, complex glycosaminoglycan extracted and purified from various tissues. This polyanion is interacting with both plasma and cells, it is able to modulate many biochemical and physiologic processes. Due to the presence of sulfate groups in different amounts and located in various positions, CS represents a very heterogeneous family of polysaccharides. therefore, the preparative approach and the analytical techniques are of paramount importance to produce CS with specific structure and properties and of pharmaceutical grade. *Includes recent technologies and methodologies to study and understand the structure and properties of chondroitin sulfate (CS) *Authoritative contributors from the scientific community with expertise in the field of CS and complex polysaccharides *Detailed and accurate figures to describe and illustrate complex molecular and macromolecular structures and properties

Malaria in Pregnancy Aug 13 2022 Malaria infection during pregnancy is an important public health problem with substantial risks to both the mother and foetus. Pregnant women are the most vulnerable group of malaria-associated morbidity and mortality. A pregnant woman has an increased risk (up to four times) of getting malaria and twice the chances of dying from malaria, compared to a non-pregnant adult, because the immune system is partially suppressed during pregnancy. Malaria in pregnancy not only affects the mother but also has a dangerous sequel for the developing foetus, resulting in premature delivery or intrauterine growth retardation. Diagnosis of malaria in pregnancy remains a challenge due to the low parasite density and placental sequestration of *Plasmodium falciparum*. Thus, there is an urgent need for new diagnostic methods to detect malarial parasites in the pregnant women. Though antimalarial drugs are available, which can be safely given in the pregnancy, increasing drug resistance of malarial parasite may pose a big problem in the future. In this chapter, we review the burden of pregnancy-associated malaria (PAM), its pathogenesis, diagnostic issues during pregnancy and recent guidelines for chemoprophylaxis and treatment.

Saving Lives, Buying Time Oct 03 2021 For more than 50 years, low-cost antimalarial drugs silently saved millions of lives and cured billions of debilitating infections. Today, however, these drugs no longer work against the deadliest form of malaria that exists throughout the world. Malaria deaths in sub-Saharan Africa "currently just over one million per year" are rising because of increased resistance to the old, inexpensive drugs. Although effective new drugs called "artemisinins" are available, they are unaffordable for the majority of the affected population, even at a cost of one dollar per course. *Saving Lives, Buying Time: Economics of Malaria Drugs in an Age of Resistance* examines the history of malaria treatments, provides an overview of the current drug crisis, and offers recommendations on maximizing access to and effectiveness of antimalarial drugs. The book finds that most people in endemic countries will not have access to currently effective combination treatments, which should include an artemisinin, without financing from

the global community. Without funding for effective treatment, malaria mortality could double over the next 10 to 20 years and transmission will intensify.

[Guidelines for the Treatment of Malaria](#) Aug 21 2020 "The purpose of this document is to provide comprehensible, global, evidence-based guidelines to help formulate policies and protocols for the treatment of malaria. Information is presented on the treatment of uncomplicated malaria, including disease in special groups (young children, pregnant women, people who are HIV positive, travellers from non-malaria endemic regions) and in complex emergency situations and severe malaria."--Publisher's description.

Cat Wars May 10 2022 Why our cats are a danger to species diversity and human health In 1894, a lighthouse keeper named David Lyall arrived on Stephens Island off New Zealand with a cat named Tibbles. In just over a year, the Stephens Island Wren, a rare bird endemic to the island, was rendered extinct. Mounting scientific evidence confirms what many conservationists have suspected for some time—that in the United States alone, free-ranging cats are killing birds and other animals by the billions. Equally alarming are the little-known but potentially devastating public health consequences of rabies and parasitic *Toxoplasma* passing from cats to humans at rising rates. *Cat Wars* tells the story of the threats free-ranging cats pose to biodiversity and public health throughout the world, and sheds new light on the controversies surrounding the management of the explosion of these cat populations. This compelling book traces the historical and cultural ties between humans and cats from early domestication to the current boom in pet

ownership, along the way accessibly explaining the science of extinction, population modeling, and feline diseases. It charts the developments that have led to our present impasse—from Stan Temple's breakthrough studies on cat predation in Wisconsin to cat-eradication programs underway in Australia today. It describes how a small but vocal minority of cat advocates has campaigned successfully for no action in much the same way that special interest groups have stymied attempts to curtail smoking and climate change. *Cat Wars* paints a revealing picture of a complex global problem—and proposes solutions that foresee a time when wildlife and humans are no longer vulnerable to the impacts of free-ranging cats.

Malaria Dec 17 2022 Malaria causes more death and disease than any other parasitic pathogen known today. This multiauthored text covers the important areas of malaria research, particularly focusing on those sectors which are of clinical importance for the understanding of the disease, the parasite, and its vector. The chapter authors are all leading experts within their own particular fields. The biology and molecular biology of the parasite, the clinical spectrum of the disease, the pathogenesis of malaria, and the immunology and emergence of malaria vaccines are some examples of the scientific spheres that are discussed.

The book is suitable as a text for graduate students and clinicians as well as researchers at universities and companies involved in treating or studying infectious diseases.

The Unsettled Plain May 30 2021 *The Unsettled Plain* studies agrarian life in the Ottoman Empire to understand the making of the modern world. Over the course of the late nineteenth and early twentieth centuries, the environmental transformation of the Ottoman countryside became intertwined with migration and displacement. Muslim refugees, mountain nomads, families deported in the Armenian Genocide, and seasonal workers from all over the empire endured hardship, exile, and dispossession. Their settlement and survival defined new societies forged in the provincial spaces of the late Ottoman frontier. Through these movements, Chris Gratien reconstructs the remaking of Çukurova, a region at the historical juncture of Anatolia and Syria, and illuminates radical changes brought by the modern state, capitalism, war, and technology. Drawing on both Ottoman Turkish and Armenian sources, Gratien brings rural populations into the momentous events of the period: Ottoman reform, Mediterranean capitalism, the First World War, and Turkish nation-building. Through the ecological perspectives of everyday people in Çukurova, he charts how familiar facets of quotidian life, like malaria, cotton cultivation, labor, and leisure, attained modern manifestations. As the history of this pivotal region hidden on the geopolitical map reveals, the remarkable ecological transformation of late Ottoman society configured the trajectory of the contemporary societies of the Middle East.

Reproductive Tract Infections Nov 11 2019 Reproductive tract infections (RTIs) have become a silent epidemic that is devastating women's lives. Each year, thousands of women die needlessly from the consequences of these infections, including cervical cancer, ectopic pregnancy, acute and chronic infections of the uterus and the fallopian tubes, and puerperal infections. For many women, this happens because they receive medical attention too late, if at all. The terrible irony of this tragedy is that early diagnosis of and treatment for many RTIs do not require high-technology

health care. For the hundreds of millions of women with chronic RTIs acquired from their sexual partners, life can become a living hell. Infection is a major cause of infertility, and it leads to scorn and rejection in many countries. These women may experience constant pain, have festering lesions of the genital tract, be at enhanced risk of second ary diseases, and endure social ostracism. The problems associated with RTIs have grown even greater in the past decade with the emergence of human immunodeficiency virus (HIV) and AIDS. Preexisting sexually transmitted disease, particularly when associated with genital tract ulcers, raises women's vulnerability to the transmission of HIV 3-5 fold.

Parasites of the Colder Climates Mar 08 2022 The parasitic load in cold northern climates is widely under-appreciated. Many texts on parasitology concentrate on tropical parasitic infections, so the reader can be forgiven for thinking that parasites are not a problem in the northern part of the world. *Parasites of the Colder Climates* redresses the balance by focusing on parasites indigenous t

[Towards Effective Disease Control in Ghana: Research and Policy Implications](#) Sep 02 2021 The Noguchi Memorial Institute for Medical Research (NMIMR) was established in 1979 as a semi autonomous Institution of the University of Ghana. In 2000 it became one of the six founding constituent institutions of the College of Health Sciences. Its original mandate, to research into infectious tropical diseases of public health importance in Ghana, has lately been expanded to include non-communicable diseases. The Institute since its inception has offered undergraduate and graduate research opportunities, and training to numerous students and scientists as well as specialized diagnostic services to support national health programmes. The varied papers presented in these two volumes show that the Noguchi Memorial Institute for Medical Research has a diverse research portfolio aimed at supporting health care policy formulation and delivery in Ghana. It envisaged that students in tertiary institutions, especially those contemplating a career in biomedical research, research scientists as well as the general public, will come to appreciate the broad field of research being conducted in the Institute. Policy makers should also find the readers useful as they provide data, which could underpin health policies in the country. Volume one presents papers on malaria while volume two covers other research areas including TB, neglected tropical

diseases, diarrhoea and viral infections as well as phyto-medicines and health systems. We hope that this will stimulate wide discussions to appreciate the work of the University and the Institute in particular. *Foodborne Parasites* Jul 20 2020 This book examines the two major parasite groups that are transmitted via water or foods: the single-celled protozoa, and the helminths: cestodes (tapeworms), nematodes (round worms), and trematodes (flukes). Each chapter covers the biology, mechanisms of pathogenesis, epidemiology, treatment, and inactivation of these parasites. This important new text offers a better understanding of the biology and control of parasitic infections necessary to reduce or eliminate future outbreaks in the U.S. and elsewhere.

Malaria in Pregnancy Feb 19 2023 Malaria in pregnancy has been a long-standing conundrum - why do women immune to the parasite after years of exposure suddenly become susceptible to infection during first pregnancies? Recent scientific breakthroughs have shed new light on interactions between the malaria parasite and the placenta, and raised hope for new drugs and vaccines to protect young mothers. The current understanding of malaria in pregnancy and the continued controversies surrounding this syndrome will fascinate all students, scientists and policy-makers interested in infectious disease and women's health.

Guidelines for the Treatment of Malaria. Third Edition Oct 11 2019 Malaria remains an important cause of illness and death in children and adults in countries in which it is endemic. Malaria control requires an integrated approach including prevention (primarily vector control) and prompt treatment with effective antimalarial agents. Malaria case management consisting of prompt diagnosis and effective treatment remains a vital component of malaria control and elimination strategies. Since the publication of the first edition of the Guidelines for the treatment of malaria in 2006 and the second edition in 2010 all countries in which *P. falciparum* malaria is endemic have progressively updated their treatment policy from use of ineffective monotherapy to the currently recommended artemisinin-based combination therapies (ACT). This has contributed substantially to current reductions in global morbidity and mortality from malaria. Unfortunately resistance to artemisinins has arisen recently in *P. falciparum* in South-East Asia which threatens these gains. This third edition of the WHO Guidelines for the treatment of malaria contains updated recommendations based on a firmer evidence base for most antimalarial drugs and in addition include recommendation on the use of drugs to prevent malaria in groups at high risk. The Guidelines provide a framework for designing specific detailed

national treatment protocols taking into account local patterns of resistance to antimalarial drugs and health service capacity. It provides recommendations on treatment of uncomplicated and severe malaria in all age groups all endemic areas in special populations and several complex situations. In addition on the use of antimalarial drugs as preventive therapy in healthy people living in malaria-endemic areas who are high risk in order to reduce morbidity and mortality from malaria. The Guidelines are designed primarily for policy-makers in ministries of health who formulate country-specific treatment guidelines. Other groups that may find them useful include health professionals and public health and policy specialists that are partners in health or malaria control and the pharmaceutical industry. The treatment recommendations in the main document are brief; for those who wish to study the evidence base in more detail a series of annexes is provided with references to the appropriate sections of the main document.

The Dangerous Passion May 18 2020 Why do men and women cheat on each other? How do men really feel when their partners have sex with other men? What worries women more -- men who turn to other women for love or men who simply want sexual variety in their lives? Can the

jealousy husbands and wives experience over real or imagined infidelities be cured? Should it be? In this surprising and engaging exploration of men's and women's darker passions, David Buss, acclaimed author of *The Evolution of Desire*, reveals that both men and women are actually designed for jealousy. Drawing on experiments, surveys, and interviews conducted in thirty-seven countries on six continents, as well as insights from recent discoveries in biology, anthropology, and psychology, Buss discovers that the evolutionary origins of our sexual desires still shape our passions today. According to Buss, more men than women want to have sex with multiple partners. Furthermore, women who cheat on their husbands do so when they are most likely to conceive, but have sex with their spouses when they are least likely to conceive. These findings show that evolutionary tendencies to acquire better genes through different partners still lurk beneath modern sexual behavior. To counteract these desires to stray -- and to strengthen the bonds between partners -- jealousy evolved as an early detection system of infidelity in the ancient and mysterious ritual of mating. Buss takes us on a fascinating journey through many cultures, from pre-historic to the present, to show the profound evolutionary effect jealousy has had on all of us. Only with a healthy balance of jealousy and trust can we be certain of a mate's commitment, devotion, and true love.
